It is improbable that these parts
contain metals, because if there were metal here the Indians would have 135
found it and put it to use; and they would naturally have come upon it
at one time or another as they are never in one place very long, changing
from one site to another in order to subsist on the game which, according
to season, moves inland or comes down to the beaches.

The weapons which they use are the bolas and the lasso, and also 411
knives and sabers which they acquire from the Pampas Indians of Buenos [439]
Aires or [79] else make themselves from any piece of iron given them 325
and which they regard highly for this reason. They also sometimes find
iron on the beaches, the remains of wrecked ships. It requires a great
deal of effort on their part to make one of these weapons because, even
though they heat the iron by fire, as they have no tools they can only
avail themselves of stones to beat it into shape then they must grind it
by hand and trim it on the rocks and give it a sharp edge and a point.

In their battles they fight on foot, leaving the women in charge 726
of the horses. They put on garments similar to men's shirts, with tight [714]
sleeves, made out of ten or twelve well-worked deer hides which no
knife or saber can penetrate. They put a sort of hat or helmet upon their
heads made of horse or bullock hide, shielded with which they attempt
to slash the enemies' legs and cut through their boots, they being more
vulnerable there. They are very resolute and persevering in battle and
do not abandon the field once upon it until they are either overpowered
or killed. They also use the bolas, and every person who is overcome is
usually killed because they become so zealous and cruel in battle that
they will not give up. This is why this region is not more thickly popu- [164
lated, for the women are very fecund and few diseases bother them. 842]

From Santa Elena to the Rio Negro the Indians say that the land 133
is parched and waterless and only in the rainy season can a few small
lakes be found. When these are dry they are obliged, when they wish 487
to go to the Rio Negro, to travel inland towards the mountains where
there are springs. As they have to travel uphill far to the west to do this
the distance is three times greater when they wish to come down to the
Spanish settlement, compared to the coastal road, if this latter had water.

The tents are pitched by sticking two poles about two or three 342
yards long into the ground, about four and a half feet from each other;
beside each pole and at an equal distance from it, they thrust two shorter
poles into the ground. To the west of these six they place six shorter ones
at an equal distance, and to the west of these at the same distance, six
others a little more than three feet long. Upon these eighteen poles they
place the hide with the hair outward, and secure it to the upper end of all
of the poles. From each pole they hang, on the inside, as it were curtains
of hide which form the necessary divisions. These curtains are tied to the
